

# React notes

React -> A javascript library for building user interfaces

VS

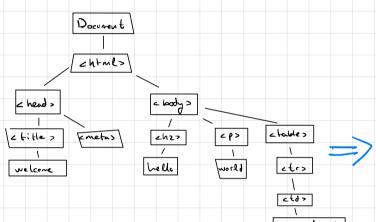

#### HTML

- Declarative for static content
- When element change whole HTML DOM is rendered. Update whole tree

## React

- Declarative for dynamic data
- When some element change virtal Dove render HTML tree from JS (in memory)

### RDOM

DOM manipulation is very expensive

There is too much memory wastage

- it updates slow

it can directly update HTML

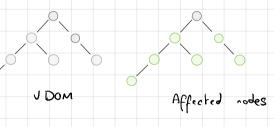

Creates a new DOM if the element updates

- It allows us to directly target any specific node (HTML element)

- it represents the vi of your app

# 1 DOM

VDOM is a programing concept where NDOM is kept in memory synced with RDOM by React DOM Library. This process is called reconciliation.

DOM manipulation is very easy

No memory vastage

it updates fast

it ear't directly update HTML

Update the JSX if the element

it can produce N 200k voom rodes/per

it's a virtual representation
